# ADDENDUM TO: WEIGHTED PROJECTIVE SPACES AND A GENERALIZATION OF EVES' THEOREM 

ADAM COFFMAN

Last update: March 4, 2022.
MSC 2010: Primary 51N15; Secondary 05B30, 14E05, 14N05, 51A20, 51M25, 51N05, 51N35, 68T45

## 7. Updates

A version of the Remainder Theorem used in the Proof of Theorem 16, Section 3 , is more specifically attributed to Sun Zi , as in [LA].

There are reviews in MR and Zbl for this article: [C].
An older version of [C] is on the arXiv: arxiv.org:1204.1686

## 8. More Examples for Section 2.2

Example 16. The monomial map $\mathbf{f}: \mathbb{R}_{*}^{2} \rightarrow \mathbb{R}^{2}:\left(z_{0}, z_{1}\right) \mapsto\left(z_{0}^{2}, z_{1}\right)$ induces a well-defined map $f: \mathbb{R} P(2,2) \rightarrow \mathbb{R} P(2,1)$ as in Lemma 8 , but the induced map is not onto. The point $[-1: 1]_{\mathbf{q}}$ is not in the image of $f$; there is no $\left(z_{0}, z_{1}\right) \in \mathbb{R}_{*}^{2}$ such that $\left(z_{0}^{2}, z_{1}\right) \sim_{\mathbf{q}}(-1,1)$.
Example 17. For $m \in \mathbb{N}$ and two weights:

$$
\begin{aligned}
\mathbf{q} & =\left(q_{0}, q_{1}, q_{2}, \ldots, q_{n}\right) \\
\mathbf{p} & =\left(q_{0}, m q_{1}, m q_{2}, \ldots, m q_{n}\right)
\end{aligned}
$$

another situation in which the map

$$
\begin{aligned}
\mathbf{f} & : \mathbb{K}_{*}^{n+1} \rightarrow \mathbb{K}^{n+1} \\
& :\left(z_{0}, z_{1}, z_{2}, \ldots, z_{n}\right) \mapsto\left(z_{0}^{m}, z_{1}, z_{2}, \ldots, z_{n}\right)
\end{aligned}
$$

as in Lemma 8 , defines an onto map $f: \mathbb{K} P\left(q_{0}, m q_{1}, \ldots, m q_{n}\right) \rightarrow \mathbb{K} P\left(q_{0}, \ldots, q_{n}\right)$ is the case where $\mathbb{K}=\mathbb{R}$ and $q_{0}$ is odd. For $w_{0} \geq 0$, make the same choices mentioned in the Proof of Lemma 8, and for $w_{0}<0$, choose $\lambda=-1$, any $z_{0}$ with $z_{0}^{m}=(-1)^{q_{0}} w_{0}=\left|w_{0}\right|$, and $z_{k}=w_{k} /(-1)^{q_{k}}$ for $k=1, \ldots, n$.
Example 18. Let $\mathbb{K}=\mathbb{R}$, and consider the weights $\mathbf{p}$ and $\mathbf{q}$ as in Lemmas 8 and 10 and Example 17. Here we assume $m$ is odd but make no assumption on $q_{0}$. Then the map

$$
\mathbf{f}\left(z_{0}, z_{1}, z_{2}, \ldots, z_{n}\right)=\left(z_{0}^{m}, z_{1}, z_{2}, \ldots, z_{n}\right)
$$

from Lemma 8 induces a well-defined, onto map

$$
f: \mathbb{R} P(\mathbf{p}) \rightarrow \mathbb{R} P(\mathbf{q})
$$

It is also one-to-one: the algebra problem is to solve the same equations (5), (6) from the Proof of Lemma 10, for a real $\mu$ in terms of real $\mathbf{z}, \mathbf{z}^{\prime}, \lambda$. Given $\lambda \neq 0$, let $\mu$ be the unique real solution of $\mu^{m}=\lambda$. Then, for $j=1, \ldots, n, \mu^{m q_{j}} z_{j}=\lambda^{q_{j}} z_{j}=z_{j}^{\prime}$, and $\left(\mu^{q_{0}} z_{0}\right)^{m}=\lambda^{q_{0}} z_{0}^{m}=\left(z_{0}^{\prime}\right)^{m} \Longrightarrow \mu^{q_{0}} z_{0}=z_{0}^{\prime}$.
Example 19. Let $\mathbb{K}=\mathbb{R}$, and consider the weights $\mathbf{p}$ and $\mathbf{q}$ as in Lemmas 8 and 10 and Example 17. Here we assume $m$ is even, $q_{0}$ is odd, and all $q_{1}, \ldots, q_{n}$ are even. Then the map

$$
\mathbf{f}\left(z_{0}, z_{1}, z_{2}, \ldots, z_{n}\right)=\left(z_{0}^{m}, z_{1}, z_{2}, \ldots, z_{n}\right)
$$

from Lemma 8 induces a well-defined, onto map

$$
f: \mathbb{R} P(\mathbf{p}) \rightarrow \mathbb{R} P(\mathbf{q})
$$

It is also one-to-one: the algebra problem is to solve (5), (6), for a real $\mu$ in terms of real $\mathbf{z}, \mathbf{z}^{\prime}, \lambda$. Given $\lambda \neq 0$, the equation $\mu^{m}=|\lambda|$ has exactly two real solutions, $\left\{\mu_{1}=|\lambda|^{1 / m}, \mu_{2}=-|\lambda|^{1 / m}\right\}$. Then, for $k=1,2, j=1, \ldots, n$,

$$
\mu_{k}^{m q_{j}} z_{j}=|\lambda|^{q_{j}} z_{j}=\lambda^{q_{j}} z_{j}=z_{j}^{\prime}
$$

For $k=1,2,\left(\mu_{k}^{q_{0}} z_{0}\right)^{m}=|\lambda|^{q_{0}} z_{0}^{m}=\left|\lambda^{q_{0}} z_{0}^{m}\right|=\left(z_{0}^{\prime}\right)^{m}$, so the set

$$
\left\{\mu_{1}^{q_{0}} z_{0}, \mu_{2}^{q_{0}} z_{0}=-\mu_{1}^{q_{0}} z_{0}\right\}
$$

is contained in the set $\left\{z_{0}^{\prime},-z_{0}^{\prime}\right\}$, and one of the two roots is the required $\mu$ satisfying $\mu^{q_{0}} z_{0}=z_{0}^{\prime}$.

Example 20. For an even number $p_{1}$, the function

$$
\mathbf{f}\left(z_{0}, z_{1}\right)=\left(z_{0}^{p_{1}}, z_{1}\right)
$$

induces a well-defined, onto map

$$
f: \mathbb{R} P\left(1, p_{1}\right) \rightarrow \mathbb{R} P(1,1)
$$

as in Lemma 8. The induced map is not one-to-one:

$$
\mathbf{f}(0,1)=(0,1) \sim_{\mathbf{q}} \mathbf{f}(0,-1)=(0,-1)
$$

but $(0,1) \not \chi_{\mathbf{p}}(0,-1)$.

## 9. More Examples for Section 3

Example 21. Example 6 shows that the space $\mathbb{R} P\left(1, p_{1}\right)$ is reconstructible. Even though the map $h_{01}\left(\left[z_{0}: z_{1}\right]_{\mathbf{p}}\right)=\left[z_{0}^{p_{1}}: z_{1}\right]$ is not globally one-to-one when $p_{1}$ is even, as shown in Example 20, it is one-to-one when restricted to $D_{\mathbf{p}}$.

The following two examples are special cases of Theorem 17, on real weighted projective spaces.
Example 22. If one of the numbers $p_{0}, p_{1}$ is odd, then the space $\mathbb{R} P\left(p_{0}, p_{1}\right)$ is reconstructible. WLOG, let $p_{0}$ be odd. For the axis projection $c_{01}\left(\left[z_{0}: z_{1}\right]_{\mathbf{p}}\right)=$ $\left[z_{0}^{p_{1}}: z_{1}^{p_{0}}\right]$, the following diagram is commutative. The label on the left arrow means that the indicated map is induced by the polynomial map $\mathbb{R}_{*}^{2} \rightarrow \mathbb{R}^{2}:\left(z_{0}, z_{1}\right) \mapsto$ $\left(z_{0}, z_{1}^{p_{0}}\right)$.

The map on the left is globally one-to-one as in Example 18, and takes $D_{\left(p_{0}, p_{1}\right)}$ to $D_{\left(1, p_{1}\right)}$. The lower right map is one-to-one on $D_{\left(1, p_{1}\right)}$ : either by Example 18 for odd $p_{1}$, or by Example 21 for even $p_{1}$.
Example 23. If both $p_{0}$ and $p_{1}$ are even, then $\mathbb{R} P\left(p_{0}, p_{1}\right)$ is not reconstructible. Consider an axis projection induced by $\mathbf{c}_{01}\left(z_{0}, z_{1}\right)=\left(z_{0}^{a}, z_{1}^{b}\right)$. By Lemma 15 we may assume that $a$ and $b$ are not both even. If $a$ and $b$ are both odd, then

$$
\mathbf{c}_{01}(1,1)=(1,1) \sim_{(1,1)} \mathbf{c}_{01}(-1,-1)=(-1,-1)
$$

but $(1,1) \not \chi_{\mathbf{p}}(-1,-1)$, so $c_{01}$ is not one-to-one. If $a$ is even and $b$ is odd (the remaining case being similar), then

$$
\mathbf{c}_{01}(1,-1)=(1,-1) \sim_{(1,1)} \mathbf{c}_{01}(-1,-1)=(1,-1)
$$

but $(1,-1) \not_{\mathbf{p}}(-1,-1)$, so again $c_{01}$ is not one-to-one.
