

Practice Questions from Appendix C Complex Numbers

1. a. Plot and label the complex numbers.

$$z_1 = 5 - 5i$$

$$z_2 = -3i$$

$$z_3 = 2\sqrt{2}e^{i3\pi/4}$$

$$z_4 = 4e^{7\pi i}$$

$$re^{i\theta} = r(\cos \theta + i \sin \theta)$$

b. Write z_1 and z_2 in exponential form $re^{i\theta}$, where r and θ are exact real numbers (and θ is in radians).

Hint: Part (a) may help.

(There are many correct answers for θ ; however, report exact **radians** please.)

$$z_1 = 5 - 5i$$

$$r = \underline{\hspace{2cm}}$$

$$\theta = \underline{\hspace{2cm}} \text{ (Radians!)}$$

Exponential form $re^{i\theta}$ of z_1 is $\underline{\hspace{2cm}}$

$$z_2 = -3i$$

$$r = \underline{\hspace{2cm}}$$

$$\theta = \underline{\hspace{2cm}} \text{ (Radians!)}$$

Exponential form $re^{i\theta}$ of z_2 is $\underline{\hspace{2cm}}$

c. Write z_3 and z_4 in rectangular form $a + bi$, where a and b are real numbers.

$$z_3 = 2\sqrt{2}e^{i3\pi/4} = \boxed{\hspace{1cm}} + \boxed{\hspace{1cm}}i$$

$$z_4 = 4e^{7\pi i} = \boxed{\hspace{1cm}} + \boxed{\hspace{1cm}}i$$

2.a. Write $(2e^{i\pi/3})^4$ in the exponential form $re^{i\theta}$, where θ is exact and in radians.

$$r = \underline{\hspace{2cm}}$$

$$\theta = \underline{\hspace{2cm}} \text{ (Radians!)}$$

Exponential form $re^{i\theta}$ of $(2e^{i\pi/3})^4$ is $\underline{\hspace{2cm}}$

b. Write $(2e^{i\pi/3})^4$ in rectangular form $a + bi$, using exact values.

$$(2e^{i\pi/3})^4 = \boxed{\hspace{1cm}} + \boxed{\hspace{1cm}} \cdot i$$

3. Consider the complex number i^{37027} .

a. A student uses a calculator to try to write the number in rectangular form $a + bi$, where a and b are real numbers. See the screen below. What should the exact answer really be? Report the exact answer in rectangular form $a + bi$:

$$i^{37027} = \boxed{\hspace{1cm}} + \boxed{\hspace{1cm}} \cdot i$$

b. When trying to write the number in polar form $re^{i\theta}$ where r and θ are real numbers, a student sees the screen below. What is the exact radian measure of the angle θ on the screen? (It involves π .)

$$\theta = \underline{\hspace{2cm}}$$

- c. Report the location of i^{37027} in the complex plane.
- A. the positive real axis
 - B. the positive imaginary axis
 - C. the negative real axis
 - D. the negative imaginary axis

4. If the complex number z is represented by a vector, describe how to construct the vector u which is the complex number z multiplied by the number $re^{i\theta}$, i.e. $u = z \cdot re^{i\theta}$.
5. Report all the fourth roots of the number -1 and sketch them on the complex plane. Write them in the form $rcis\theta$ (using radians) and in rectangular form $a + bi$.
6. Report all the fourth roots of the number $-64i$ and sketch them on the complex plane. Write them in the form $rcis\theta$ (using degrees) and in rectangular form $a + bi$.
8. Consider the complex geometric series $f(z) = \sum_{k=0}^{\infty} 50z^k = 50 + 50z + 50z^2 + 50z^3 + \dots$ which converges

on $|z| < 1$. Report the value of $f\left(\frac{3i}{4}\right) = \sum_{k=0}^{\infty} 50\left(\frac{3i}{4}\right)^k$.

- a. We separate even powers of $\frac{3i}{4}$ and odd powers of $\frac{3i}{4}$.

$$f\left(\frac{3i}{4}\right) = \sum_{k=0}^{\infty} 50\left(\frac{3i}{4}\right)^k = 50\left(1 + \left(\frac{3i}{4}\right)^2 + \left(\frac{3i}{4}\right)^4 + \left(\frac{3i}{4}\right)^6 + \dots\right) + 50\left(\left(\frac{3i}{4}\right)^1 + \left(\frac{3i}{4}\right)^3 + \left(\frac{3i}{4}\right)^5 + \left(\frac{3i}{4}\right)^7 + \dots\right)$$

First simplify powers of i .

Then combine real parts in the first row and imaginary parts in the second row.

Then factor out 50 in the first row and $50 \cdot \frac{3i}{4}$ in the second row. Enter **real** numbers in each box.

You can write the real numbers as powers of $\frac{3}{4}$.

$$f\left(\frac{3i}{4}\right) = 50\left(1 + \boxed{} + \boxed{} + \boxed{} + \dots\right) + 50 \cdot \frac{3i}{4}\left(1 + \boxed{} + \boxed{} + \boxed{} + \dots\right)$$

- b. The geometric series $1 + \left(\frac{3i}{4}\right)^2 + \left(\frac{3i}{4}\right)^4 + \left(\frac{3i}{4}\right)^6 + \dots$ has $a = 1$ and $r = \boxed{}$ and sum equal to $\boxed{}$..

The geometric series here has $a = 1$ and $r = \boxed{}$ and sum equal to $\boxed{}$.

- c. Combining, we have $f\left(\frac{3i}{4}\right) = \sum_{k=0}^{\infty} 50\left(\frac{3i}{4}\right)^k = \boxed{} + \boxed{}i$ (Insert integers in the boxes.)
