## Thomas the Tank Engine's Maximum Speed

Turn in the following by the beginning of the class Thursday, Jan. 12 to receive +2 Rhino bonus participation points. Thomas the Tank Engine is $d=f(t)$ miles from his boss Sir Topham Hatt, where $t$ is given in hours. The graph of $d=f(t)$ is shown for $0 \leq t \leq 7$. See his trip animated at users.pfw.edu/lamaster/ma165/ThomasTrip.htm

You may assume only the following
$d(t)$, miles away from Sir Topham Hatt
$d^{\prime}(t)$ is quadratic with axis of symmetry at $t=3$.
Note: $d^{\prime}(1) \neq 0$ and $d^{\prime}(5) \neq 0$.
Below is a table of values for $d(t)$.

$x=3$

1. Find a formula for $d(t)$ using the FTC. Show work for credit.
 We have $\int_{0}^{t} d^{\prime}(x) d x=d(t)-d(0)$ so, by subtraction,

$$
d(t)=\int_{0}^{t} d^{\prime}(x) d x+d(0), \text { where } d^{\prime}(x)=a(x-3)^{2}+k \text { for some constants } a \text { and } k .
$$

Report exact values of the coefficients. Check your answer with a grapher.
Your formula need not be in expanded form.
$d(t)=$ $\qquad$
2. Thomas reaches a maximum speed on $1<t<5$ at $t=3$ hours.
a. Report the exact value, in miles per hour, of that maximum speed.
$\qquad$
b. Report, approximate to 0.001 hours, the two other times at which he reaches that maximum speed in part 2a on $0<t<7$.
You can solve graphically. No work needs to be shown.
$t=$ $\qquad$ hrs, $\qquad$ hrs
Report to three decimal places.

$d(t)$, miles away from Sir Topham Hatt
