

Phys125 Take home project:

You have a banana which is still green. However, a monkey, your pet, only wants to eat a yellow banana. It's already too late to run out to get another and you don't want your monkey to starve. Therefore, your mission is to make the green banana look yellow and fully matured so that the poor monkey will just have it.

Your goal of the project: take a picture with your technique so that in your picture, half of the banana shows the original green color and the other half appears yellow in your picture.

The tools you may use: you may use anything related with the knowledge you learn in the class. Examples include, not exclusively, using filters, using illuminations, using color additive/subtractive approaches ... The only EXCEPTION is that post-processing of the picture is NOT allowed! (As shown in my sample, it was not a legitimate solution!)
